

MEDICAL LITERATURE DATABASE SEARCH TOOL

**ABSTRACT**

This invention provides a method of identifying clinically relevant, evidence based medical literature on diseases and their treatment to physicians, nurses and other healthcare personnel. This method accesses a medical literature database that is then searched using a medical literature classification system identifier for a disease integrated with an evidence based medicine search filter. In conjunction with identifying the evidence based medical literature, a database of articles selected and reviewed by experts that concern the disease is also searched. The results of both searches are then displayed to the user. This invention can be implemented through the use of an encoded computer readable medium.
